

#234028 Quinacridone Pink D, PV 19

Quinacridone Pink D is a strong, cool and almost garish pink, which could also be described as raspberry red. The luminosity develops a strong presence that is enhanced by multiple applications. It also develops striking drying edges that play into rusty red. Even the first thin application produces a homogeneous, even surface. Particularly attractive is the mixture with the similarly intense Indigo (see under #360008 Indigo).

The mixture here was created together with #234908 Purple Red (lowest color application in each case).

Mould-made Paper

Cotton Rag Paper

Chinese Rice Paper

Hot Pressed Paper

Influence and properties of painting surfaces

The "colorfulness" or character of a pigment is influenced not only by the different binders; a significant expression is also created by the different textures of the various painting surfaces.

For example, glazing pigments appear even more "transparent" on rice paper and seem to become "one" with the painting surface. On canvas, regular or hand-made paper, on the other hand, they appear more solid and stable.

Properties of hand-made paper (German: Büttenpapier)

- Low density
- Soft, velvety
- Voluminous, full-bodied
- Firm, stable
- Absorbs a lot of water and the color penetrates deeply

Properties of Chinese rice paper

- Dissolves with "too much" water
- Transparent (as a result, the light behind the painting surface has different effects on the paint application)
- The paint soaks through the paper and is highly runny
- practically untextured

Properties of cotton rag paper

- "woven" paper with regular, tiny corrugation
- slightly shimmery effects
- The color seems to move
- Clear texture

Properties of hot pressed paper

- Certain firmness and rigidity (less flexible)
- Clear lines and contours
- Smooth, dense surface
- Less absorbent, color penetrates less into the paper and runs more evenly
- Less "shadow" due to lack of texture
