

#404308 Dark Burnt Sienna

Dark Burnt Sienna fired impresses with its earthy structure. Especially with saturated application, the color develops a cloudy, material effect on all papers. Another striking feature is the different color temperature. On handmade paper, it appears cool and goes in the direction of violet. A warmer note with a tinge of yellow is seen on Cotton Rag paper. Even on the first application on rice paper, the color has a strong presence, which is otherwise rare on this thin paper.

The blend was created together with #402208 Gold Ochre Italian (lowest color application in each case).

Mould-made Paper

Cotton Rag Paper

Chinese Rice Paper

Hot Pressed Paper

Influence and properties of painting surfaces

The "colorfulness" or character of a pigment is influenced not only by the different binders; a significant expression is also created by the different textures of the various painting surfaces.

For example, glazing pigments appear even more "transparent" on rice paper and seem to become "one" with the painting surface. On canvas, regular or hand-made paper, on the other hand, they appear more solid and stable.

Properties of hand-made paper (German: Büttenpapier)

- Low density
- Soft, velvety
- Voluminous, full-bodied
- Firm, stable
- Absorbs a lot of water and the color penetrates deeply

Properties of Chinese rice paper

- Dissolves with "too much" water
- Transparent (as a result, the light behind the painting surface has different effects on the paint application)
- The paint soaks through the paper and is highly runny
- practically untextured

Properties of cotton rag paper

- "woven" paper with regular, tiny corrugation
- slightly shimmery effects
- The color seems to move
- Clear texture

Properties of hot pressed paper

- Certain firmness and rigidity (less flexible)
- Clear lines and contours
- Smooth, dense surface
- Less absorbent, color penetrates less into the paper and runs more evenly
- Less "shadow" due to lack of texture
