

98120 – 98121 Kölner Miniatur

Kölner Miniatur products are developed for the gilding of paintings and writings (calligraphy).

Product feature: On the basis of a watery, glycol-containing acrylic dispersion. It contains small quantities butylcarbitol. Make sure that there is sufficient ventilation while working with this product!

Application:

High gloss gilding and silvering. Particularly used on paper and other flexible surfaces, but can also be used on non-flexible surfaces. Kölner Miniatur should be processed at a room temperature between 15 – 25 °C. Additional dilution with water is possible. However, this should not exceed 5 %. It can be stored for at least 1 year after production. Brushes, pens and so on should be cleaned with soap and water, as long as the size has not formed a film. For longer works, periodic cleaning with water can become necessary, in particular with high temperature surroundings. Cleaning with alcohol or acetone is possible after filming.

Product description:

The elastic nature of the size assures a long lasting gilded surface. The turning of illuminated pages will not cause the leaf to delaminate. Adhesion is guaranteed on paper, vellum (degreased), smooth leather and different plastic foils (plasticizer-free), as well as on metal-concealed papers (aluminium) and a lot of other materials.

Miniatur is especially important for gilding in the domain of book illumination. Even without agate burnishing, surfaces with spectacular high-gloss can be achieved. Miniatur works perfectly when high gloss is desired, especially for small surfaces.
